Is it possible to do the traffic shaping for the hardware node and the VM's?
For eg we limit the hardware node port speed to 10mbps and VM's uplink to 2mbps each.

Thanks

It's as easy as 1-2-3.

1. Open a new tab in your browser, type wiki.openvz.org into the "Location" field. Press Enter. Browser will open OpenVZ wiki's Main Page.
 2. Look at the left column. You will notice the box called "search", with an input line and two buttons in it. Type in "traffic shaping" and click on either button.
 3. A page with search result will appear. Click on the first result, this will be Traffic shaping with tc. Read the page carefully and follow the instructions.
