It freezes on the line:

No dock devices found.

Hello,

please, clarify your experiment a bit:

- 1) which host OS do you use?
- 2) which kernel can you use normally?
- 3) output of:

```
# rpm -qa --queryformat "%{name} %{version} %{release} %{arch}\n" | grep kernel
```

If you'll see 2 entries for ovz kernel - one 32 bit and one 64bit, then please, remove 32bit version kernel and reinstall 64bit ovz kernel manually - this hopefully will fix the issue.

if not:

- 4) complete bootlogs for the native kernel which boots ok
- 5) ``lspci`, `lspci -n``
- 6) boot loader config
- 7) ``mount``

preferably we'll need the complete logs of ovz kernel booting - you can get it with serial console (you can find info on our wiki), but we can try to findout something if you send us at least a picture of the screen with hanged ovz kernel.

Thank you.

--

Konstantin

Thanks the mistake was mine.

yum installed both 686 and x64 kernels.

I must have been trying the 686 kernel.

I removed all OpenVZ kernels, and just had the X64 installed and it booted fine.
