Subject: GFS version in OpenVZ kernel?
Posted by aniou on Sat, 23 Aug 2008 10:59:51 GMT

I have installation of CentOS 5.2 with current kernel (2.6.18-92.1.10.el5). GFS modules from RH
are provided by separated packages:
kmod-gfs-0.1.23-5.el5
kmod-gfs2-1.92-1.1.el5_2.2

..and their versions, reported in kernel messages, are:
GFS2 Overlay (built Jun 21 2008 21:27:08) installed
GFS 0.1.23-5.el5 (built May 25 2008 03:59:58) installed

OpenVZ kernel (ovzkernel-2.6.18-92.1.1.el5.028stab057.2.x86_64.rpm) provides own gfs
modules with unknown wersions:
GFS2 (built Jul 21 2008 17:12:08) installed
GFS <CVS> (built Jul 21 2008 17:11:32) installed

In addition I'm not able to rebuild gfs-kmod-0.1.23-5.el5.src.rpm with OpenVZ sources due to
conflicts, for example:
 /usr/src/redhat/BUILD/gfs-kmod-0.1.23/_kmod_build_/src/gfs/g lock.c:2755: error: too few
arguments to function 'invalidate_inodes'

So, I have following question:
- what version of GFS/GFS2 modules contains OpenVZ "RHEL5" kernel and how looks reliability
of that modules, comparing to "original", provided by RHEL5/CentOS?

arguments to function 'invalidate_inodes'

Yes, it's impossible compile that modules as is due to OpenVZ modification in fs/inode.c. You
could look at the appropriate patch that does these modifications.

what version of GFS/GFS2 modules contains OpenVZ "RHEL5" kernel

It's based on gfs-kmod-0.1.16-5.2.6.18_8.el5.src.rpm.
But some changes was done, some potential bugs are fixed.
To find out what exactly was done you can install ovz.src.rpm, then go to SOURCE directory.
There must be a set of diff-gfs* files.

Thank You.

Hi!

I noticed that GFS2 in OpenVZ is quite updated. Comparing to
gfs2-kmod-1.92-1.1.el5_2.2.src.rpm from RH, diff shows some changes but the DLM (part of gfs2
package from RH) is identical - diff doesn't show any differences.

But the GFS1 is quite old, there is only one (!) patch from RH since 2006.

I've been able to build OpenVZ kernel with the newest GFS1 from RedHat. I patched sources from
 gfs-kmod-0.1.23-5.el5_2.2.src.rpm (from RH) and used it with OpenVZ source rpms
(2.6.18-92.1.1.el5.028stab057.2). There were only 3 changes needed:
- removal of diff-gfs-rh-truncate-corruption-20070521 (the one) from kernel-ovz.spec
- substitution of diff-gfs-kmod-0.1.16 with one I did from gfs-kmod-0.1.23-5.el5_2.2.src.rpm
- some minor changes in diff-gfs-vzquota-20070521 (changing order of couple lines).

I'm attaching patch against installed kernel-ovz source rpms (/usr/src/redhat). Installation
procedure is simple:
1. cd /usr/src/redhat
2. zcat gfs1-from-rh-to-ovz.patch.gz | patch -p0

Artur
