Subject: nfs and autofs

So I've been playing around with openvz and I really need autofs and nfs working.

AFAICT bind mounts don't work with autofs, right? I did discover that I can create a new automount process on the HN with something like this:

automount --timeout=60 /vz/root/101/home file /etc/auto.openvz

Where /etc/auto.openvz contains this:

*   :/home/&

The HN mounts the correct directory from the NFS server and then the additional automount daemon does bind mounts to /vz/root/101/home. The VE then gets all the /home mounts correct.

Does anyone else do it like this? Are there any issues?

Andy

Hi Andy,

well, looks like you are right, bindmounts are mounted on a Container's start and are not used with autofs.

But probably you can use nfs mounts right inside a Container?
http://wiki.openvz.org/NFS

Hope that helps.
