I am finding myself in the situation where I need to create about 16 different templates (for different OSes/archs) for software testing. When looking through the wiki for information on how to do this, I came across http://wiki.openvz.org/Creating_a_Red_Hat_Template_with_mach which would be very useful for automating this process.

Unfortunately, this is the only mention of mach w/ openvz I can find (even through google). I was wondering if anyone else had any information on this tool, as it seems to be somewhat obscure.
