---

Hi,  
I have a dedicated server, fully virtualized with openvz (and hypervm for manage). In a vps i have cPanel.  
When I attempt to add a new ip in WHM, appears in red.

When i make:

```
root@server [/etc]# service ipaliases restart
UnRouting 62.212.74.1xx SIOCDELRT: No such device
                                [FAILED]
Shutting down eth0:1 eth0:1: unknown interface: No such device
                                [FAILED]
Bringing up eth0:1 SIOCSIFADDR: No such device
eth0:1: unknown interface: No such device
SIOCSIFNETMASK: No such device
SIOCGIFADDR: No such device
SIOCSIFBROADCAST: No such device
SIOCSIFBRDADDR: No such device
eth0:1: unknown interface: No such device
                                [FAILED]
Routing 62.212.74.1xx SIOCADDRT: No such device
                                [FAILED]
```

-----  
And, if i put:

```
[root@localhost ~]# vzctl exec 110 /etc/init.d/network restart
Shutting down interface venet0: [ OK ]
Shutting down loopback interface: [ OK ]
Bringing up loopback interface: [ OK ]
Bringing up interface venet0: SIOCADDRT: Network is unreachable
[ OK ]
```

What is happening? Is a vps networking problem?? (is working apparently good).

Thanks!

Regards,  
Amil

Hi,  
The main problem was the "alternate ethernet device" (was no set to virtual interface) but still with problems....  
Here explain..

In "Alternate Main Ethernet Device" i set it to: "venet0:0".

"Add new ip address" - i can add ip, and in "Show IP address usage" I can see IPs that i have added in GREEN.

But.. for example I migrate a hosting to dedicated ip and recognizes IP but ping timeout.. can't establish connection.  
It seems could be any kind of network config...

Here, the interfaces and addresses assigned:

This is the main interface, working perfectly:

```
venet0:0 Link encap:UNSPEC HWaddr 00-00-00-00-00-00-00-00-00-00-00-00-00-00-00-00
inet addr:62.x.x.160 P-t-P:62.x.x.160 Bcast:62.x.x.160 Mask:255.255.255.255
```

And two IP i have added later in WHM but..doesn't ping:

```
venet0:0:1 Link encap:UNSPEC HWaddr 00-00-00-00-00-00-00-00-00-00-00-00-00-00-00-00
inet addr:62.x.x.165 P-t-P:62.x.x.165 Bcast:62.x.x.191 Mask:255.255.255.192
UP BROADCAST POINTOPOINT RUNNING NOARP MTU:1500 Metric:1
```

```
-----
venet0:1 Link encap:UNSPEC HWaddr 00-00-00-00-00-00-00-00-00-00-00-00-00-00-00-00
inet addr:62.x.x.167 P-t-P:62.x.x.167 Bcast:62.x.x.191 Mask:255.255.255.192
UP BROADCAST POINTOPOINT RUNNING NOARP MTU:1500 Metric:1
```

IN MASTER:

The master server have this config (in eth0), this is the dedicated:

```
eth0 Link encap:Ethernet HWaddr 00:19:B9:F9:C6:65
inet addr:62.x.x.152 Bcast:62.212.74.191 Mask:255.255.255.192
```

```
venet0 Link encap:UNSPEC HWaddr 00-00-00-00-00-00-00-00-00-00-00-00-00-00-00-00
UP BROADCAST POINTOPOINT RUNNING NOARP MTU:1500 Metric:1
RX packets:17626388 errors:0 dropped:0 overruns:0 frame:0
```

(venet0 in master not show any ip).

Regards,

Amil

Hi,

I solved this adding manually a secondary ip, with vzctl in master:

```
vzctl set {CTID} --ipadd {n.n.n.n} --save
```

Once made, in WHM, i recalculate ip-pool and I can now work with this ip fully, working 100%.

For any reason, if I add the ip with cPanel doesn't assign correctly the ip (in network restart unmade network changes), maybe is a cPanel bug over OpenVZ. Or maybe a problem related to hypervm.

Hope this help, thanks.

Regards,  
Amil
