Hi All,

I setup an openVZ server and installed 2 VEs there. All is good except one thing: there is no swap available for VEs. On parent server all looks ok:

```
=====
# free
      total    used    free   shared  buffers   cached
Mem:   4141608 3834984  306624     0    178040 3095728
-/+ buffers/cache:  561216 3580392
Swap:  4096564     0 4096564
=====
```

but on VEs it's not:

```
=====
# free
      total    used    free   shared  buffers   cached
Mem:   4141608 485956 3655652     0     0     0
-/+ buffers/cache: 485956 3655652
Swap:     0     0     0
=====
```

So the question is: how can I setup swap for VEs?

Thanks in advance for any help.

Hello,

check this links will help you to understand

(http://wiki.openvz.org/UBC_systemwide_configuration#Memory_and_swap_space)

and

(http://wiki.openvz.org/Setting_UBC_parameters)

and to hide your UBC

vzctl set CTID --meminfo none --save --setmod restart

regards

Alaa Eldin

Hi Alaa,

thanks much, that helped a lot! I read the documentation before posting here but not carefully enough so missed the right section.
