I have been using Proxmox with Debian templates to build PBX phone systems using asterisk. Works great and I am really pleased with it.

Anyway, shutdown my server yesterday using the GUI and Shutdown Server command. This morning I came in and turned it on gained SSH access to the HOST and all GUESTS (all pbx's are running fine) BUT when I hit the IP address of the server in my browser the page cannot be found. Its pingable obviously.

Any ideas, anyone...? Is there a command to rebuild..? please excuse my idiocy.

Regards

There must be a web server running on your host. Please make sure that you started it.
