Hello,
I'm using linux 2.6.18 and I would like to use the command "accton" in a virtualized computer.
In the host computer, it works fine.
But in the virtualized machine, I have a message like "operation not permitted".

Is ACCT supported in openvz ?

Thank you

Hi,

try

```
vzctl stop $VEID  
vzctl set $VEID --capability sys_pacct:on --save  
vzctl start $VEID
```

But this seems to be accounting the whole system information of all VE's and the HN.

Not only the VE's processes Is there any patch or fix?
