hi,

sorry I do not understand - only that "WebVZ" part

Well, I would like to not use WebVZ (I tried it already once) so I would rather stick with command line (yet?).

I'm using OpenVZ since many years(4?) but haven't tried vlans; now I have to and find that wiki isn't helpful at all.

And moreover, searching through this forum doesn't help either (search gives not useful or not useful for me answers).

thanks!

BTW I tried also Proxmox and it works nice, but it doesn't include vlans configuration (and it lack storage configuration among other more serious disadvantages).

Machine translation:

At me in the corporate project 4 servers with OpenVZ, and on the approach on the sly were going to some more. There was a question with the control panel. Perhaps, someone worked with HyperVM (<http://lxlabs.com/software/hypervm/full-feature/>) and there are positive and negative responses? I yet have not understood their price policy, but even with unnecessary LxAdmin it costs not much

I tried WebVZ - but it somehow not such as it is necessary.
