Hi,
What are the best values, in a server medium-load in number of processes and cpu_limit?
If I leave blank (no limit) for cpu and processes a malicious user can get all resources from master machine?In a heavy use of VE?

It´s good to stablish some limits in use of cpu, processes or anything?

Thanks for help and advices

Regards,
   Victor Amil

use vzsplit to divide your HN into reasonable slices of resources

the output configs will contain the numbers you are looking for
