Hi,

When I try to have access way SSH, it delay a little and asks for to the Login and password. I place the password and it delay sufficient of to legalize! If I to enter for the SSH in the main IP of the server, it it has access normal and well fast. I limited the VPS in 256MB of RAM and 15% of the processor (2.4GHz)

this usually happens when unaccessiable DNS server is written in /etc/resolv.conf
check the line starting from 'nameserver'

Hi,

Dns is normal. It has access the SSH of the VPS, but of very slow form!

Can you strace sshd from the host and take a look on what does it do and what it is waiting for?

run `strace` command. Something like:

strace -ff -o strace.out ssh root@VPS_IP

I also use `ssh -v root@VPS_IP` and `tcpdump` commands for network issues debugging.
