
Subject: Disable ipv6 on HN

I'd like to disable ipv6 on a hardware node and still run the vz service.

I created a file in /etc/modprobe.d/ with following contents and rebooted:
install ipv6 /bin/true

This caused the ipv6 kernel module not to be loaded.

Now however, I am unable to start an containers:

```
[root@openvz1 vz]# vzctl start 102
Starting container ...
Container is mounted
Invalid kernel, or some kernel modules are not loaded
Container start failed
Container is unmounted
```

My /etc/vz/vz.conf has IPV6="no".

Is there any way to get Openvz to run with the ipv6 kernel module unloaded like this?

Thanks.
