Hello!

I've read that the new 2.6.16 Kernel supports virtualisation of meminfo.

So i've upgraded to 2.6.16-026test014 and vzctl version 3.0.10.

But if i login to an vps cat /proc/meminfo shows the complete amount of memory...

Any ideas?

Stefan

OK - I solved it myself - you have to set a special value --meminfo "pages:NUMPAGES" for the vps with vzctl.

Sorry
