Subject: container shows not real cpu consumption with "top" command

Hello, with quad core processor I create container with --cpuunits 16 (4% of all cpus) and I launch CS 1.6 server. When there are ~16 players there are no lag, when 20+ of players - ping for the players goes up sharply but in `cat /proc/user_beancounters` failcnt is 0 in all parameters. I think this is because lack of cpu but with command `top` or `htop` the cpu is shown ~0-5%.

Why container doesn't show it's cpu consumption? I think that container shows main server's cpu consumption but not container's. I'm right?
