hello all,

How can be known the consumption of CPU of a single virtual machine?

I need to know the CPU consumption of any machine from the EV 0. IS possible?

The CPU consumption with respect the EV 0.

Thanks

-----EDIT-----

If I make

```
vzctl exec 111 top b -n 1 | grep 'Cpu(s)'
```

I obtain the cpu usage into de VPS 111, this usage corresponds at the global CPU usage??? I have made some tests and it seems yes that...approximately

other way is making: `head -n 1 /proc/stat`

I obtain value for CPU usage...these values corresponds to a global CPU ?? I say...these values says me the cpu usage of the virtual machine in the main machine???

thanks
