I am a little new so bear with me.

I recently set up a Centos 5 server, and have ran through installing openvz, I am to the part of installing the vztmpl and am unable to proced.

I entered:

```
yum -y vztmpl-centos-4-2.0-2
```

I was then given a bunch of switch options.

Are there new templates for install and where, do I need to download to the centos server or can I pull them in with the above command?

Thanks,

You do not have to install vztmpl tools, just download the precreated templates from <http://wiki.openvz.org/Download/template/precreated> and put those to /vz/template/cache. Then you are ready to create containers!

Are there any GUI interfaces for openvz as there is for Virtuozzo?

Do you know if the you know if they have stopped vtonf?

I was able to create a VPS and it is running however I still have some questions.

First, I am running through a tutorial and was trying to install yum to the container and am getting an error there is no OS template.

the command I ran is:

vzyum 101 install yum

after which they want to run the following command

vzyum 101 install yum-plugin-fastestmirror

Any suggestions?

Thanks, I was able to get vtonf to work as well.

Will these VPS be running a GUI? How do I remote to them, or install their OS's?

I am still looking for info on this.
