Hello!

Using ALT Linux Sisyphus (20081222) 2.6.27-ovz-smp-alt1.1 , vzctl version 3.0.23. I use WebVZ for configuring via web new containers, and no matter what precreated template I use, if I select "Start up the container after creating it", I always get an "Oops". The sistem hangs apparently, I cannot start, stop or destroy any container, I cannot kill the hangded PIDs of vzquota (that sets the limits for the new container) and I cannot kill the vzctl start <ID> of new container.

If I issue reboot or shutdown -r now nothing happens.

I have to reboot with the RESUIB method (Ctrl+Alt+Sys Rq+RESUIB), and push the reset too after. It also works remounting in read only mode and "echo 1 > /proc/sys/ kernel/sysrq", "echo b > /proc/sysrq-trigger".

Any ideaa ? Is the problem with WebVZ or with AltLinux kernel or OpenVZ ? I am using ALT Linux Sisyphus (20081222), kernel 2.6.27-ovz-smp-alt1.1.

If the problem is with WebVZ, what other alternative for a web management of OpenVZ do I have, excluding HyperVM/Vtonf ?

I guess you'd better ask ALTLinux guys. And note that 2.6.27 is still quite unstable.

Thanks, I did a "downgrade" to 2.6.26 and it now works ok.

The guys @ALTLinux said the same, kernel issue. Bad thing that my board does not work with 2.6.18, SATA Controller driver issues.

Are you sure? Check RHEL5-based OpenVZ kernel — there are lots of patches for newer

hardware, including SATA.

Verry sure. I tried it too, and also 2.6.18-alt, made by the guys at ALTLinux, for AltLinux Server. But it now works, though the server is under test for some days.
