Hi

i had installed open vz with hypervm on Cent os 5.2

when i create a vps it do not work !

i think problem is on my ip's configuration but when i try to enter to vps with openvz console i see :

```
[root@ip-70-38-11-200 cache]# vzctl enter 110
```

```
Unable to fork: Cannot allocate memory
```

i try to find a way to fix it on this forum but i just find that !

```
"cat /proc/user_beancounters"
```

i had run this command and i paste it here :

```
[root@ip-70-38-11-200 cache]# cat /proc/user_beancounters
```

```
Version: 2.5
```

1. Use CODE tags when you quote something from the command line, especially /proc/user_beancounters output since it's aligned in columns.
2. Why you pay to HyperVM but ask for support here? You are HyperVM customer, why don't you use their support line?
3. Your numproc is set to 1, this is the reason.

hi

- 1 . i am not hyprvm customer i use it free for 5 vps
- 2 . this problem is on open vz not in hypervm when i create a vps manually with command this

problem make too

3. please explain more . what is my numproc is 1 mean ?
thanks.
