
Subject: running xbmc Media-Center into a Container?

Hi,
I have installed XBMC in a container, the installation occurred without any error, but when I am trying to start it, this error is displayed:
XBMC can not run without direct rendering, please install a valid opengl driver
OpenGL seems not to be installed on the Containers, but it is on the host. Is there a way to solve the problem? I have tried the XForwarding, as explained in a 'how to', but this did not solve the problem. As the hardware is not virtualized (I mean, the containers use the same hardware as the host) It must be a way to get the direct rendering of opengl into the container the same way it runs in the host!
Thanks for your help!
