Hi,

I wonder what was rationale for introducing libvzctl-simfs library.

Since this library references to symbols defined in libvzctl, it cannot be loaded without loading libvzctl.

It can't supposed to work standalone.

libvzctl-simfs introduced for VE file system type selection.

Then vzctl will support more file systems appropriate library will used.

It was a try to split vzctl and make it plugin based.

however, due to lack of time and low prio it was stopped
on the early stages... :/ Rudiments...

I see. Anyway, if shared library references to symbols defined in another shared library, then it should link with that library. That is, I suggest to merge libvzctl-simfs back to libvzctl. Also, I suggest to move "g_log" symbol from vzcfgvalidate binary to libvzctl. After that, libvzctl will be self-contained, thus enabling both --as-needed and prelink support.

At least, I had to apply these changes to package vzctl for Sisyphus.

Dmitry,

Can you please send your patches (if you have those) -- we'll take a look and possibly commit them.

The patch I made to package vzctl for Sisyphus just merges libvzctl-simfs back to libvzctl. Since you want to implement plugin support some day, I reworked the change, this patch may be more appropriate.

Rework libraries to support ld --as-needed.

Makefile:

Relocate libraries from /usr/lib/vzctl/lib to /usr/lib.

Drop rpath.

Move logger to separate libvzlogger library.

Add sonames to all shared libraries.

Link libvzctl-simfs with libvzlogger.

Link libvzctl with libvzctl-simfs and libvzlogger.

Link vzctl, vzlist, vzmemcheck and vzcfgvalidate with libvzlogger.

Raise LIB_VER.

logger.c:
Define export g_log variable.

vzcalc.c, vzcfgvalidate.c, vzctl.c, vzlist.c, vzmemcheck.c:
Use g_log variable from libvzlogger.

vzctl.spec:
Relocate libraries from /usr/lib/vzctl/lib to /usr/lib.
