hello,
on my server is overflowed ram:

plex:/# vzctl enter 101
enter into CT 101 failed
Unable to fork: Cannot allocate memory

container itself has enough memory allocated and in munin it has more than half free, the parent
server but does not have much spare. It may be caused by this error? Or am I wrong by
configuration? (I can not even exclude)
Thank you very much

Hello,

please examine carefully /proc/user_beancounters output. Are there any failcounters?
