Hi,  
I have some VPS on my HN and each of them runs a http server (apache server)  
My virtual network is a private one (every IP addresses are private, like 192.168.10.101)  
I can set up a port forwarding for one VPS, (every requests to the IP-address of the HN port 80 goes to the VPS port 80) but how is it possible to set up port forwarding for each of my VPS?  
For example, on the first one, there is a website <http://www.myDomain.com>, on the second one <http://www.myOtherDomain.com>  
(I don't want to change the default port of the server)  
Thanks a lot for your help!

In the same situation, i have a VPS that runs haproxy and that handle all requests on port 80.  
  
Then using the proper configuration, haproxy redirects the requests to the proper VPS.
