Hello,

I am attempting to enable TUN/TAP support in my containers.

I follow the guide:

http://wiki.openvz.org/VPN_via_the_TUN/TAP_device

And enable right iptables modules in master to work correctly.

But appears to be unworking. I am trying to install Plesk with VPN support and a message appears:

Installing the package psa-vpn-2.0.1-cos5.build92090422.13.x86_64 (b 0x21a66900
source=0x1edc0920 P:221 R:11)

====> Checking kernel support for TUN/TAP

Plesk VPN cannot be run under your version of Virtuozzo.

Virtuozzo 2.6.1 or later is required.

The installation cannot continue.

error: %pre(psa-vpn-2.0.1-cos5.build92090422.13.x86_64) scriptlet failed, exit status 1

Thanks for help

Regards,
Amil

This is more related to Plesk than to OpenVZ, please ask their support.
