I'm following the wiki guide I created, but I'm getting an error.

Stopping container
rsync: writefd_unbuffered failed to write 4 bytes [sender]: Broken pipe (32)
rsync: write failed on "/vz/private/117/var/lib/mysql/ibdata1": Disk quota excee
rsync: connection unexpectedly closed (33348 bytes received so far) [sender]
rsync error: error in rsync protocol data stream (code 12) at io.c(463) [sender=
Error:  Failed to sync container private areas
Starting container ...

This went away when I stopped the VE.  What's up?

OPT:--remove-area
OPT:--keep-dst
OPT:121
This program is used for container migration to another node.
Usage:
vzmigrate [-r yes|no] [--ssh=<options>] [--keep-dst] [--online] [-v]
       destination_address <CTID>
Options:
-r, --remove-area yes|no
       Whether to remove container on source host after successful migration.
--ssh=<ssh options>
       Additional options that will be passed to ssh while establishing
       connection to destination host. Please be careful with options
       passed, DO NOT pass destination hostname.
--keep-dst
       Do not clean synced destination container private area in case of some
       error. It makes sense to use this option on big container migration to
       avoid re-syncing container private area in case some error
       (on container stop for example) occurs during first migration attempt.
--online
       Perform online (zero-downtime) migration: during the migration the
       container freezes for some time and after the migration it
       keeps working as though nothing has happened.
-v
       Verbose mode. Causes vzmigrate to print debugging messages about
       its progress (including some time statistics).

I get that when I run the migrate all live containers command.
