I am curious to know if anyone here has had the same issue i have been having..

I can not seem to get more than 49 VM's running on any given PC.

I am running a 3rd party we interface on top of openvz, and have also tried creating more VM's thought the cmd line, and still have the same issue with having max VM's at 49.

I have tried this on 20+ PC's with various hardware configurations, and 49 is the "cap" for each and every one.

I am trying to figure out if my issue has something to do with the web interface I'm using or if it's an openvz issue.

Thank you for your input.

What error do you get trying to create the 50th VM?

the only error i got from all the logs was that the permissions were dented, unable to mount...

I have discovered though other forums that it is a kernel issue, and will be solved on the next release.
