hi

i'm having troubles setting up some firewall rules inside a VPS. Here is the rule that i'm trying to set:

```
iptables -A OUTPUT --proto tcp -s 192.168.1.20 -d 0/0 --dport 22
```

the result is:

```
iptables: No chain/target/match by that name
```

If i run the same command on the hardware node there are no problem, what am i doing wrong?
can somebody help me?

Thanks a lot,
Diego Gonzalez

PD: by the way, i didn't set anything through `vzctl set --iptables`, in my understanding this should let all the modules be accessed and used from the VPS, is that right?

this is very simple rule which uses `iptables_filter` only and it should work.

Please, check:

1. that you have iptables modules loaded before VPS start.
2. check your default iptables modules mask in `/etc/sysconfig/vz` global config.

P.S. it sets not all modules, it sets default set of modules.
