Hi

I have a new install of Openvz on Centos 5 and i am seeing really poor performance compared to other openvz installs. The main difference i am seeing on this new install is some raid1 processes appearing when i use the top command. i see a few process like md1_raid1 or md2_raid1. I am not sure what these relate to as the server is a dedicated server from fasthosts and therefore i am unaware of its specific build.

By poor performance i mean,
- poor file transfer speeds
- other ve's affected by poorly performing other VE's
- HN poor performance

I currently have 5 ve' running on the same config's i have on another server that is running 15 VE's without a problem.

As always help greatly appreciated

Shaun

Hi,

Quote:
- HN poor performance

Could you please load a pure CentOS kernel? Does it helps you?
