Hello all

I recently installed SolusVM for controlling my VPSs on a fresh CentOS5 installation. I created some VPSs. they are all working fine but the problem is VPSs from ID101 to 105 (first 5 VPSs) are working fine and VPSs i made after that are behaving strange wget not working and connection drops sometimes speeds are worst (5-6Kbps sometimes and even 0Kbps) but when i try to download the same in other VPSs (from 101 to 105) it is working as usual and downloads at 800Kbps-1.2Mbps

Hi,

the description of the problem that you provided is very vague.
If it is connected to SolusVM please ask them to look at your system.
We are lack of details to give you a valuable advice.
