
Subject: vzctl enter CT via SSH (wrapper?)

My VPS provider allows me to SSH into the host node to get to my VE, and I was just wondering how that is done so I can duplicate the functionality on my local install of OpenVZ (as its handy when you've locked yourself out of your VE by flushing iptables or stopping sshd or something!)

Basically I SSH into the host node with a username and password and it seems to perform a "vzctl enter <veid>" as I get the prompt:

```
entered into CT 102
```

```
root@vps:/#
```

Like you do with "vzctl enter 102".

Is this a built-in function of OpenVZ, or is it some sort of hacky wrapper such as replacing the shell of my HN user with "sudo vzctl enter 102" or something?

seem its a login - wrapper with sudo, op or other tools execute cmd with root priviliges, executed on login via ssh

for a bashed solution see man bash, section "INVOCATION"
bash_profile, bash_login, .profile ... etc.

Bye,
Thorsten
