---

Is it preferable to run

- 1) openvz in an KVM/Xen container, or run
- 2) Kvm in a openVZ container?

1) seems to be more secure

2) brings better performance. Does 2 work?

----

Is it possible to hide the processes running in vz-clients from the host, only showing (one) process per vz-client?

-----

How can I access (host-) loop or cryptsetup-Devices from inside a vz-client?

Is it unsecure if loop is compiled i the kernel (ollowing to mount anything including files containing devices)?

thanks, Andrew
