Hi,

I want to increase the open files limit "ulimit -n" just for one user inside one container but I'm bothering the following question:

For example inside the container for the http user with ID: 108 I set the "ulimit -n 2048" and http user runs httpd daemon, the problem is that on the hardware node the ID 108 is ntp so when I run "ps -aux" I see that the ntp user runs httpd on the hardware node.

So I'm wondering do I need to increase the ulimit for the ntp user on the hardware node also???

Hi,

when top runs on the HN it corresponds number 108 to ntp-user name but it's just a way to show information, nothing more. So, you don't have to alter settings on the HN.
