Okay, a few questions:

a) How to limit CPU's to MHz?

I want to limit a server to MHz, such as 500 or 2500 MHz.

Also, I want to specify the amount of cores

b) Burstable memory?

I want to give people a guaranteed amount of RAM, and burstable RAM incase the host has any left.

c) Bandwidth

How would I see how much GB of bandwidth a VPS has used for a month?
