Hi !

Im trying to make an iptables rule like :

```
iptables -A FORWARD --match state --state RELATED,ESTABLISHED -j ACCEPT
```

But i got this error message :

iptables: No chain/target/match by that name

I have allready installed the ip\_conntrack module, but apparently I have to install also nf\_conntrack

It is possible in OpenVZ ?

I'm running Debian on both (HN and CT).

Hi,

have you restart your container after loading the kernel modules on hardware node ?

Bye,  
Thorsten

Yes...

In fact, the module ip\_conntrack works fine, but now needs nf\_conntrack
