Hello,

I am getting the following error when installing apf,

```
iptables v1.3.5: can't initialize iptables table `mangle': Table does not exist (do you need to insmod?)
```

Perhaps iptables or your kernel needs to be upgraded.

Any help appreciated.

You're trying to use the apf firewall inside a container?

You should first 'modprobe iptable_mangle' on the host before starting the container. Then give the container permissions with a command like 'vzctl set 101 --iptables iptable_mangle'.

Before trying apf you could try using iptables directly with something like 'vzctl exec 101 iptables -t mangle -L'. The apf software probably requires other netfilter modules as well.
