Hi friends!

This is my first post. Sorry my poor english.

I have a QuadCore, 8Gb RAM and Centos 5.3, with VMWare Server 2.

I did install the OpenVZ and everything is ok.

OpenVZ kernel: 2.6.18-128.2.1.el5.028stab064.8

So, I need reconfigure the VMware Server 2, and recompile the OpenVZ kernel with VMware modules.

But, I can't find the OpenVz Kernel headers.

Can someone help me, please?

None of the pre-built vmmon modules for VMware Server is suitable for your running kernel. Do you want this program to try to build the vmmon module for your system (you need to have a C compiler installed on your system)? [yes]

Using compiler "/usr/bin/gcc". Use environment variable CC to override.

What is the location of the directory of C header files that match your running kernel? [/usr/src/linux/include]

The directory of kernel headers (version 2.6.18-128.el5) does not match your running kernel (version 2.6.18-128.2.1.el5.028stab064.8). Even if the module were to compile successfully, it would not load into the running kernel.

What is the location of the directory of C header files that match your running kernel? [/usr/src/linux/include]

Thanks a lot!

Fabio S.

Hi Fabio,

kernel headers are in ovzkernel-devel package, can be taken here:

[http:// download.openvz.org/kernel/branches/rhel5-2.6.18/028stab064. 8/](http://download.openvz.org/kernel/branches/rhel5-2.6.18/028stab064.8/)
