now I'm installing OpenVZ under debian,

after setting up, compiling, installing the Ovz kernel, i reboot.

then i try to install the Ovz tools using the following commands:

```
#echo "deb http://debian.systs.org/ stable openvz" >> /etc/apt/sources.list
```

```
#apt-get update
```

then i pass to install the packages

```
#apt-get install vzctl vzquota
```

and here i get the error that something went wrong with the last programs.

I reboot anyway, and while restarting i get this error

```
Starting OpenVZ: lsmod: QM_MODULES: Function not implemented
```

```
lsmod: QM_MODULES: Function not implemented
```

..failed

```
dpkg: error processing vzctl (--configure):
```

```
 subprocess post-installation script returned error exit status 255
```

```
Errors were encountered while processing:
```

```
vzctl
```

```
E: Sub-process /usr/bin/dpkg returned an error code (1)
```

i tried also to unistall and reinstall, using
apt-get remove vzctl vzquota
and also
apt-get --purge remove vzctl vzquota
and reinstalling.
same result.

did i miss something?
thanks

Hi atomico80,

self-compiled kernel ... and the modules are on your system ?

When "/etc/init.d/vz" start after the installing process ...
the init script tries to load some modules ... but can't be loaded ... please check your kernel config.

Regards,
Thorsten

check that you have CONFIG_MODULES=y in your kernel config

dev wrote on Sun, 09 July 2006 13:36check that you have CONFIG_MODULES=y. in your kernel

config

checked. and CONFIG_MODULES=y.

I checked in the /usr/src/linux-2.6.8/configs/kernel-2.6.8-022stab078-i686.config.ovz

and also in /usr/src/linux-2.6.8/kernel-2.6.8-022stab078-i686.config.ovz

what else can i do?

thanks for the help.

when you build a kernel ".config" file is used.

check it, not kernel-2.6.8-022stab078-i686.config.ovz

P.S. check http://wiki.openvz.org/Kernel_build for more details.
