Hi, I am trying configure a LVS_NAT in OpenVz but ipvsadm dont work. When I type ipvsadm -L I get

```
FATAL: Error inserting ip_vs (/lib/modules/2.6.18-164.2.1.el5.028stab066.7/kernel/net/ipv4/ipvs/ip_vs.ko): Operation not permitted
```

Can't initialize ipvs: Permission denied (you must be root)

Are you sure that IP Virtual Server is built in the kernel or as module?

I looking for that in forum but dont have solution.

I read that the solution is charge the module in the machine with kernel openvz and the containers will work, but I get the same problem.
