Hi!

I'm trying to follow this guide to be able to run pppd within a container  
[http://wiki.openvz.org/PPP\\_in\\_container](http://wiki.openvz.org/PPP_in_container)

```
[root@centos ~]# vzctl set 102 --features ppp:on --save
```

Warning: Unknown feature: ppp:on

Bad parameter for --features: ppp:on

```
[root@centos ~]# rpm -q vzctl vzctl-lib
```

vzctl-3.0.23-1

vzctl-lib-3.0.23-1

Can I find somewhere a built version of vzctl with ppp support?

```
[root@centos ~]# grep DEV /etc/vz/conf/102.conf
```

DEVICES="c:10:200:rw c:108:0:rw "

Is it okej to have multiple devices in the DEVICES declaration in the conf file?

(space separated or comma seperated?)

```
root@centos ~]# lsmod | grep ppp
```

ppp\_mppe 10372 0

ppp\_deflate 9728 0

zlib\_deflate 21912 1 ppp\_deflate

ppp\_async 15232 0

ppp\_generic 31884 3 ppp\_mppe,ppp\_deflate,ppp\_async

slhc 10240 1 ppp\_generic

crc\_ccitt 6144 1 ppp\_async

```
[root@centos ~]# vzctl enter 102
```

entered into CT 102

```
[root@vz102 ~]# ll /dev/ppp
```

crw----- 1 root root 108, 0 Dec 13 13:01 /dev/ppp

```
[root@vz102 ~]# ifconfig ppp0 up
```

ppp0: unknown interface: No such device

```
[root@vz102 ~]# /usr/sbin/pppd
```

/usr/sbin/pppd: This system lacks kernel support for PPP. This could be because

.

.

Obviosly it doesn't work

Any more hints ot tips?

seems a bit unclear in [http://bugzilla.openvz.org/show\\_bug.cgi?id=268](http://bugzilla.openvz.org/show_bug.cgi?id=268) if this should work or not?

Thanks in advance

Michael

Hi,

please pay attention to "Caveat" section

Quote:

It currently requires a version of vzctl patched with this patch

According to "Caveat" section you need kernel "rhel5 064.4 or later".

I'm running kernel 2.6.18-164.2.1.el5.028stab066.10 which should be safe?

My problem is that the ppp feature is unknown to vzctl:

```
[root@centos ~]# uname -a
Linux centos.localdomain 2.6.18-164.2.1.el5.028stab066.10 #1 SMP Sat Dec 12 12:51:59 MSK
2009 i686 i686 i386 GNU/Linux
[root@centos ~]# modprobe ppp_async
[root@centos ~]# modprobe ppp_async
[root@centos ~]# modprobe ppp_async
[root@centos ~]# lsmod | grep ppp
ppp_async      15232  0
ppp_generic    31884  1 ppp_async
```

```
slhc          10240 1 ppp_generic
crc_ccitt     6144 1 ppp_async
[root@centos ~]# vzctl set 102 --features ppp:on --save
Warning: Unknown feature: ppp:on
Bad parameter for --features: ppp:on
```

According to Caveat it is not only required a fresh kernel but also a patched vzctl.

---

---

Yes, I know...in my first post I asked where "I can find a built version of vzctl with ppp support?"

Of do I have to download the source and compile it myself?

Any hints?

Yes, it's an easy task to do.  
It may be performed something like that.

```
# git clone git://git.openvz.org/pub/vzctl myvzctl
# cd myvzctl
# ./autogen.sh
# ./configure
# make
```

Yepp! That solved my problems...With the new vzctl I can now run ppp in a container

Thanks for all help!

Michael
