Subject: Max number of VZ's on one server

To all you OpenVZ'ers, we are putting together a vps service and need some hard numbers on how many VZ's a server is capable of handling. If you could describe your experience in stress testing OpenVZ with detailed hardware descriptions (i.e. brand, cpu's, memory, etc.), the number of VZ's you fit on that server, and the VZ's appropriated memory and cpu. I would really appreciate your help!
