Hi

I have got a bug written on Debian vzquota package.
See <http://bugs.debian.org/377414> for full information.
We have some disagreement on the severity of it but that is not important for you.

You can see from here
<http://buildd.debian.org/build.php?pkg=vzquota>
that it build fine on most archivtectures but not powerpc and s390 because of a warning. I do not know why it treat warnings as (I have not looked that the build options that much) errors but you may know that.

Can you please take a look on these build logs and create a patch for that?

Regards,

// Ola

Ola, afair the openvz-stuff is only supposed to run/work on x86 type hardware
(maybe even ia64).

Officially supported platforms are:

- x86 (a.k.a. i386)

- x86_64 (a.k.a. AMD64, a.k.a. EM64T)

- ia64 (a.k.a. Itanium)

Still, tools' code should be portable... Attached patch fixes the bug.

PS Package build fails probably because of -Werror in CFLAGS set in

vzquota's Makefile.

The patch is now in GIT: <http://tinyurl.com/nde9u>
