
Subject: Container start failure when ipv6 is disabled

Hello,

I am a long time user of OpenVZ. I've setup a new machine for which I disabled ipv6 support in order to troubleshoot some OpenVZ unrelated networking issues and I stumbled on a problem.

If ipv6 support is completely disabled using the modprobe.d approach, containers fail to start.

If the following option is entered in a file under /etc/modprobe.d

```
options ipv6 disable=1
```

Containers fail to start with the following dmesg output:

```
CT: 170: failed to start with err=-12
CT: 110: stopped
kmem_cache_create: duplicate cache ndisc_cache
```

Call Trace:

```
[<ffffffff8003aa8d>] kmem_cache_create+0x5e8/0x624
[<ffffffff80229ce9>] neigh_table_init_no_netlink+0x8d/0x37a
[<ffffffff80226a89>] neigh_sysctl_register+0x241/0x275
[<ffffffff80229fe4>] neigh_table_init+0xe/0x90
[<ffffffff8836689f>] :ipv6:ve_ndisc_init+0x6f/0xeb
[<ffffffff883c4446>] :vzmon:do_env_create+0x951/0xded
[<ffffffff883c4e74>] :vzmon:vzcalls_ioctl+0x2b8/0x5ee
[<ffffffff8828516f>] :vzdev:vzctl_ioctl+0x34/0x50
[<ffffffff800437fa>] do_ioctl+0x21/0x6b
[<ffffffff80031181>] vfs_ioctl+0x457/0x4b9
[<ffffffff800c00a0>] audit_syscall_entry+0x180/0x1b3
[<ffffffff8004eaae>] sys_ioctl+0x3c/0x5c
[<ffffffff800602dd>] tracesys+0xd5/0xe0
```

My setup is as follows:

OS:

CentOS 5.4 64-bit

Kernel:

```
2.6.18-164.2.1.el5.028stab066.10 #1 SMP Sat Dec 12 18:52:53 MSK 2009 x86_64 x86_64
x86_64 GNU/Linux
```

Tools:

vzquota-3.0.12-1
vzctl-lib-3.0.23-1
vzctl-3.0.23-1

There is no problem if NETWORKING_IPV6=no is set in /etc/sysconfig/network so i think this is a bug or something.

If i remove the /etc/modprobe.d file containing the ipv6 disable=1 option and reboot the system containers start to function as usual.

I think it's more or less related

http://bugzilla.openvz.org/show_bug.cgi?id=651

main idea- why do you want disable ipv6 support?

Well,

Since ipv6 is not widely available and still not mainstream there are a few reasons why ipv6 would need to be disabled due to compatibility reasons.

I didn't encountered a scenario that would require ipv6 to be explicitly disabled but a warning would be a more correct approach to signal a sysadmin that ipv6 is required for a vps to start than a stack dump don't you agree ?

The bug mentioned by you seems unrelated to the situation I encountered since it clearly stated that ipv6 is disabled when an ipv6 address was used for a vps.

I didn't attempted to assign an ipv6 address to my containers, they all use ipv4 addresses.

The cryptic nature of the error message determined me to create this thread more with a fyi purpose than to require a fix for it.

Otherwise i would have opened a bug report in the bugzilla.

Most people disable ipv6 for security reasons. In a tight environment many times you don't have a choice.

It would be nice to run a batch of openvz tests after a "rm -f ipv6.ko". And the opposite: with ipv6 enabled and ipv4 disabled

Openvz's target audience may be in those situations.

Hi,

Bug. If you create container then you can run it one time then not possible to start again.

Enabling ipv6, will disable it by iptables6
