---

Hi,

I am designing a small custom VPS panel for my VPS hosting business.  
I wanted to use the VPSs IP at a particular port to load the Servers Control Panel

e.g. The IP 88.88.88.88 is the VPS IP and 77.77.77.77 is the servers main ip  
My control panel files are on the main server at /usr/local/panel/

I want to load the panel from the URL:  
`https://88.88.88.88:8888`

These should load the files from the main server at /usr/local/panel/

Virtuozzo does it. So how is this going to be possible ?  
Do I have to use IP tables and NAT to do it :  
[http://wiki.openvz.org/Using\\_NAT\\_for\\_container\\_with\\_private\\_IPs](http://wiki.openvz.org/Using_NAT_for_container_with_private_IPs)

I am a newbie at this so please help me.

Regards,  
Rick

Please help me someone.

Will this do the trick :  
`iptables -t nat -A PREROUTING -p tcp -d 88.88.88.88 --dport 8888 -i eth0 -j DNAT --to-destination 192.168.0.1:8888`

Whats the internal IP of the server is it 192.168.0.1 OR 10.0.0.0

Please help someone. I have spent nearly a week trying to figure this out.
