Hello.

I have a problem when config VPSs in server. Because server is use CPU i7 920, have 4 core, 8 thread.

So server only working up to 50% CPU of 8 CPU (I use top command).

Help me config VPSs only used 25% core. If I have 16 node in this server.

Will I set cpulimit is 50 or 25?

Use vzctl set --cpus to set the number of CPUs you want the container to use. Note it only works in a stable (rhel5-based) kernel.
