hi

Using 2.6.8-022stab078-smp

I have problems using iptables nat on host computer with the ovz kernel.

Iam trying use static NAT one-to-one, from a ip placed on eth1 to a secondary ip on venet0 placed on eth0 but not work on ovz host machine, the iptables rules work on others machines with generic kernel.

192.168.153.252 --- eth1:0 Host Computer IP  
192.168.100.153 --- venet0:1 VPS Secondary IP

Rules

```
iptables -t nat -A OUTPUT -d 192.168.153.252 -j DNAT --to-destination 192.168.100.153  
iptables -t nat -A PREROUTING -d 192.168.153.252 -j DNAT --to-destination 192.168.100.153
```

I need made NAT from 192.168.153.252 to 192.168.100.153

Note: On other generic Kernels this rules work, but on the vz kernel not work. any IDEA?

check the last entry in FAQ: on 2.6.8 kernels you need to enabled conctracks in host system which are disabled by default.  
<http://openvz.org/documentation/faq>

also check wiki page about NAT if needed:  
[http://wiki.openvz.org/Using\\_NAT\\_for\\_VE\\_with\\_private\\_IPs](http://wiki.openvz.org/Using_NAT_for_VE_with_private_IPs)

iam read

[http://wiki.openvz.org/Using\\_NAT\\_for\\_VE\\_with\\_private\\_IPs](http://wiki.openvz.org/Using_NAT_for_VE_with_private_IPs)

and placed on modules.conf

thisa line

```
options ip_conntrack ip_conntrack_enable_ve0=1
```

But Not Work

Any IDEA.?

Fernando

```
# service vz stop
# service iptables stop
# lsmod | grep ip_conntrack (check that unloaded)
# modprobe ip_conntrack ip_conntrack_enable_ve0=1
# cat /proc/net/ip_conntrack (if exists, conntracks are loaded properly)
```
