Subject: Add VLANs support to HN/VEs

Hello,
I have VLAN id #11 configured on the router and /27 subnet assigned to it.
How can I add support for this VLAN on HN and create VEs with IPs in the above subnet ? The subnet is a public IP address block.
HN is running on CentOS 4.x; I followed all the how-to's I found online but it didn's help, all I can do is ping the gateway but can't go anywhere. Of course routing on the gateway is enabled.
Could anyone please provide any tips regarding such configuration ?
Thanks!
