---

Hi, I've checked this forum and found some problems that look similar, but none of them helped me to resolve my issue.

I am running gentoo and I've tried to install Debian 5.0 from cache downloaded from link found on OpenVZ wiki.

Here is the output:

```
dell ~ # uname -a
Linux dell 2.6.32-openvz-belyayev.1dell #3 SMP Mon Jun 7 14:04:52 CEST 2010 i686 Intel(R)
Pentium(R) 4 CPU 2.80GHz GenuineIntel GNU/Linux
dell ~ # cd /vz/template/cache/
dell cache # ls
debian-5.0-x86.tar.gz
dell cache # vzctl --version && vzquota --version
vzctl version 3.0.23
Vzquota version 2.5.0
dell cache # vzctl create 101 --ostemplate debian-5.0-x86
Creating container private area (debian-5.0-x86)
Running: /usr/sbin/vzquota stat 101 -f
Running: /usr/sbin/vzquota drop 101
Running: /usr/sbin/vzquota init 101 -b 1048576 -B 1153024 -i 200000 -l 220000 -p

```

2010-06-07T15:21:53+0200 vzctl : CT 101 : Received signal: 9 in /usr/sbin/vzquota

dell cache # lsmod

Module	Size	Used by
vznetdev	11804	0
vzrst	109535	0
vzcpt	93712	0
vzdquota	30732	0 [permanent]
vzmon	14240	3 vznetdev,vzrst,vzcpt
vzdev	1627	3 vznetdev,vzdquota,vzmon

I've also included some additional output which could help.

After these commands system crashes (becomes unusual), maybe because of kernel panic, memory lack or something similar. I can't check this because I have only SSH access.

This is probably accompanied by the oops (which you can see using dmesg utility). Is it possible for you to run dmesg right after this problem happens and then file a new bug to [bugzilla.openvz.org](http://bugzilla.openvz.org)?
