Hi!

I have one host machine with two Network cards:

Eth0: 10.10.10.10

eth1: 192.168.0.10

I would like to dedicate eth1 directly to only one container running on the host, and I don't want the other hosts to access to this interface. They shouldn't even know it exists.

How should I do this?

It's like I would like to have a network card directly connected into the Virtual container, trough the host.

Thanks for the help!

Tibby

Hello, try --netdev_add option of vzctl utility. I hope it helps you to do exactly what you want.
