Hi folks,

Would it be possible to create a template by just tarring up an existing vps? I would like to have a template that has some specific utilities.

Thanks.

Yes, it's possible.

Here is an exampe of template creation using this way:

http://forum.openvz.org/index.php?t=post&reply_to=4710&a mp;

Ok i got the right link. But that's a handful, and anyway, what i gather from the link is that, if i have to create a template from an already running vps, all i need to do is:

```
tar -czf vps-template.tgz /vz/private/101
```

Is that right?

Thanks a lot for your time.

Almost all.
You have to remove information inside this VE, that is specific to this VE only. Well, some data, IP information, etc...

Good luck.

I just want to create a vps-template with some more packages installed than the original one. So what i do is this:

```
vzctl create 50 --ostemplate centos-default
```

i am not assigning any ips or anything.

```
vzyum 50 install yum
```

```
tar -czf centos-default-with-yum.tgz /vz/private/50
```

i am not even starting up the vps. Just create, install using vzyum, and package again.

Thanks.

Then feel free to just tar VE.

Hi,

I tarred up the thing and created my own template, but now when i use that template, it says 'unable to get full ostemplatename' and then it fails to set any of the limits properly and teh vps doesn't start. It is possible that i am not doing it right at all, but any help would be appreciated.

Thanks

Sorry.

It was all my fault. The thing is openVZ seems to be reusing the conf files of destroyed vpses. There is a file called as 100.conf.destroyed, which contains some parameters. What is this? And why is this used when i create a vps with teh same id?

Thanks.

This file is created when you destroy VE with appropriate VEID. After that "100.conf.destroyed" is never used! I.e. new config file will be created when you create new VE with the same VEID.
