Not sure what is going on but just upgraded using yum and when I restart the vz service it fails to start and VEs. I don't dare shut down what is currently running because I'd be out of business.

```
Bringing down interface venet0:              [  OK  ]
Stopping OpenVZ:                             [  OK  ]
Starting OpenVZ:                             [  OK  ]
Bringing up interface venet0:                [  OK  ]
Starting CT 115:                             [FAILED]
Starting CT 135:                             [FAILED]
```

vzctl says:

2010-06-30T13:19:45-0700 vzctl : Setting CPU units: 1000
2010-06-30T13:19:45-0700 vzctl : WARNING: Settings were not saved and will be reset to original values at the next start (use --save flag)
2010-06-30T13:20:01-0700 venetclean : CT 115 : CT died, clear IPs:

Not sure what to do but starting to freak out.

Reverting back to 3.0.23 fixes the problem. 3.0.24 is broken.

I found that you'd already filed the bug. Thank you very much.
Just in case, if somebody needs it http://bugzilla.openvz.org/show_bug.cgi?id=1564

Dear Marc,

I've been trying to find out the reason but unfortunately I couldn't. Here some details that might be useful:

-
Quote:
vzctl says:

2010-06-30T13:19:45-0700 vzctl : Setting CPU units: 1000
2010-06-30T13:19:45-0700 vzctl : WARNING: Settings were not saved and will be reset to original values at the next start (use --save flag)
2010-06-30T13:20:01-0700 venetclean : CT 115 : CT died, clear IPs:

Did the last message appear at the same moment as "service vz restart" was issued? May it appear earlier?

-
Quote:
venetclean : CT 115 : CT died, clear IPs:

This message may appear when "vpsnetclean" script is running. This script is scheduled in /etc/cron.d/vz but I don't know what can break the starting process. Here are information about changes in this script:

http:// git.openvz.org/?p=vzctl;a=history;f=scripts/vpsnetclean.in;h
b=d50cdb66e59945a46b57e94642ac2c3b72080448

-
I was able to reproduce "CT died" message but wasn't able to reproduce your problem. Nevertheless, we know that the problem appears when /etc/init.d/vz was invoked. So I'd recommend you to verbose
"vzctl start ..." output (/etc/init.t/vz - 415 line)

```
fi
        msg=`$VZCTL start ${veid} 2>&1`
        print_result "$msg"
```

Please, set VERBOSE and LOG_LEVEL to 10 in /etc/vz/vz.conf.

If it doesn't help it may be useful to get the previous "msg" value.
